

General notes on span tables for wall panels with hidden fixing

Note the following:

- The characteristic loads are to be determined according to the terms of valid standards and eurocodes.
- Choose the minimal supporting width from wind pressure, wind suction and **wind suction (cp1 values)** for hidden fixing for the respective case of application.
- Colour groups I (very light), II (light) and III (dark) – see approval.
- This span table is valid for buildings with normal interior climate (no cold store or ripening facilities).
- Valid supporting widths are stated in meters (m), supporting widths in millimetres (mm), see example below. The stated supporting widths apply to multi-span installation and direct attachment up to max. 3 screws per intermediate support line and meter. When using more than 3 screws per meter, the crush tension needs to be checked according to the requirements of the approval.
- Valid supporting widths for hidden fixing only apply for the version of fixing stated in the table. Deviating fixings are to be calculated separately. Values for the calculation are to be taken from the approval, enclosure 2a. Consider values (cp1) as wind suction load for fixing.
- Deflection amounts to a maximum of L/200 under consideration of all unfavourable loads according to approval.
- In each case a separate proof for fixing material is required (for tensile load of wind suction and temperature, for pulling-out of the subconstruction and for screw-head-deflection). **A high tensile capacity and therefore a high supporting width for a hidden fixing is achieved by a symmetrical subconstruction with adequate thickness of material.**

Example:

from wind pressure table:

40
5,70
60

- end support width necessary (mm)
- valid supporting width (m)
- intermediate support width necessary (mm)

(lowest value from the tables)

valid supporting width

visible fixing
= 5,70 m

hidden fixing
= 4,05 m

from wind suction table:

6,13

- valid supporting width (m)

from table wind suction with hidden fixing:

4,05

- valid supporting width (m)

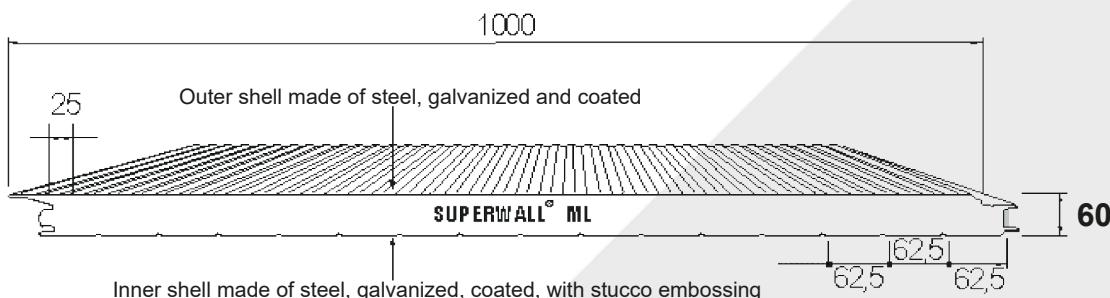

Span table 23-06

As of 06 / 2020

Superwall ML (SU1/S) 60 mm

$t_N = 0,60 / 0,45 \text{ mm}$, S320GD

Max. valid supporting widths stated in the following are calculated according to approval Z-10.49-516 with additions from 23rd June 2011 in accordance with EN 14509. The directions for the application of the table can be gathered from the frontpage.
